

Left column — Order Management

Capacity Report — Order Management. Peak throughput during the month-end close reaches 4,200 requests per second against the Order API. After ord-api-01 was resized to 16 vCPU in July, the cluster sustains month-end at about 70 percent CPU with headroom for a single node failure. Memory pressure is the binding constraint during batch reconciliation, when the working set grows to roughly 26 GB per node.

Right column — Fleet Tracking

Capacity Report — Fleet Tracking. Telemetry ingestion averages 18,000 GPS events per second with bursts to 45,000 during shift changes. The Kafka cluster is provisioned for three brokers; consumer lag stays under two seconds. The PostgreSQL time-series store grows about 40 GB per week and is the leading candidate for a managed-database target in the migration.
