

Zephyr Logistics — Platform Architecture Brief

This brief captures the current-state architecture of Zephyr's order management and fleet-tracking platforms ahead of the Azure migration assessment. The estate spans three tiers hosted across two on-premise datacenters (DC-North and DC-South) with a small AWS footprint for analytics.

The Order API is business critical and depends on the Payments Service and the Identity Provider. Fleet Tracker ingests GPS telemetry via a Kafka topic and writes to a PostgreSQL time-series store.

Core server inventory (extract):

hostname	role	os	vcpu	memory_gb
ord-api-01	Order API	RHEL 9	8	32
ord-api-02	Order API	RHEL 9	8	32
pay-svc-01	Payments	Windows Server 2022	4	16
fleet-db-01	PostgreSQL	Ubuntu 22.04	16	64

Note: pay-svc-01 was documented as Windows Server 2016 in the 2023 runbook; operations confirm it was rebuilt on 2022 during the last patch cycle. This conflict is intentional for reconciliation testing.
